

Minibar Fridge Ventilation Requirements

Keep it working like BRAND NEW

When integrating your minibar fridge of choice into your hotel/motel room cabinetry, it is crucial that the surround area of the minibar fridge must have unhindered airflow and good head dissipation.

To achieve the best cooling performance and optimal lifespan, the minibar fridge needs at least 200 cm² free air inlet.

This space should be kept constant to allow for the air outlet at the top of the cabinet surface to function.

The rear of the minibar fridge should also be at least 50 mm clear from the furniture wall that you are installing into.
